

Mobiloitte — Enterprise Technology Services Knowledge Base

KB File 4 of 4 · Source: mobiloitte.com (enterprise technology services page)

KNOWLEDGE-BASE TEST MARKER — Document ID: **KB-DOC-04-TECHSERVICES** | Unique test phrase for this file only: **“Obsidian Enterprise Marker”**
If the chatbot's answer contains this exact phrase or Document ID, the response was sourced from THIS file.

Your AI Makes Decisions. We Make Sure They're Fast, Safe, and Provable.

Mobiloitte helps enterprises build, govern, secure, and scale digital systems across AI, cloud, cybersecurity, blockchain, web, mobile, and automation — delivering production-ready technology services designed for measurable business outcomes and regulatory compliance, from strategy through deployment.

Enterprise Pain Points Addressed

The Governance Crisis

Teams often deploy AI tools without IT visibility into what data those models access or expose to regulators.

Reality: “Only 1 in 5 enterprises has a mature model for governing autonomous AI agents.”

The ROI Gap

Most technology leaders can't answer whether results are there, because no financial framework was built to measure them.

Reality: “98% of B2B companies say positive digital ROI is critical to survive.”

The Compliance Avalanche

Regulations are accelerating — the DPDP Act (India) carries penalties up to ■250 Crore per violation, and annual audits alone no longer suffice.

Reality: “The EU AI Act is now in effect, governing how AI systems are built & monitored.”

The Vendor Sprawl Problem

The average enterprise manages 14+ vendors across web, mobile, cloud, AI, and security, adding cost, complexity, and risk.

Reality: “40% faster deployment achieved by consolidating to a unified stack partner.”

Results Clients Bring to Their Boards

Metric	Value	Detail
Faster time-to-market	40%	Delivered through automated CI/CD pipelines and MLOps-integrated sprint cycles.
System uptime SLA	99.97%	Across cloud-native architectures running agentless zero-trust security.
Digital ROI acceleration	3x	Achieved using Technology Business Management (TBM) frameworks.
Enterprise deployments	500+	Delivered across AI, web, mobile, blockchain, and IoT service lines.

Metric	Value	Detail
Regulatory fine exposure	0	For every client on continuous DPDP, GDPR, and SOC 2 compliance programs.
Average agentic MVP	18 Days	From discovery session to first autonomous workflow in production.

One Partner. Every Layer of the Stack.

Agentic AI & Intelligent Automation

- Autonomous workflows 24/7
- AI Governance Framework implementation
- Governed data layers
- Integration Ops (IntOps)

Web & Cloud-Native Engineering

- Legacy enterprise system modernization
- Multi-cloud AI interoperability
- Enterprise data fabric modernization
- FinOps-integrated delivery

Mobile & Cross-Platform Engineering

- HIPAA, GDPR, DPDP compliance
- Offline-first field operations
- AI-embedded mobile experiences
- MDM compatibility & audit trails

Blockchain & Cryptographic Trust

- Cryptographically logged AI decisions
- Decentralized identity (DID)
- Secure smart contract development
- Supply chain transparency

The Converiqa Framework (6 Stages)

- **1. Discovery** — TBM methodology maps investments to ROI baselines before engineering begins.
- **2. Architecture** — designing agentless zero-trust security and AI governance into the foundation.
- **3. Agile Sprints** — shipping working software every two weeks with automated CI/CD and MLOps.
- **4. Hardening** — compliance baked in as a system behavior running parallel to engineering.
- **5. Deployment** — zero-downtime go-live using IntOps frameworks activated from day one.
- **6. Optimization** — ongoing FinOps reviews and quarterly ROI reports against baseline.

Problems Already Solved (Client Case Studies)

Industry	Case	Result
Financial Services	Fraud Prevention & DPDP Compliance	67% fewer fraud false-positives. Agentless zero-trust data fabric for a Tier-2 bank process

Industry	Case	Result
Healthcare	Clinical Decision Support App	35% faster clinical decisions. HIPAA-grade clinical mobile application for 2,000+ active u
Supply Chain	Global Visibility & ESG Tracking	91% disruption prediction accuracy. Multi-cloud AI and blockchain providing transparenc
Enterprise SaaS	System Modernization & FinOps	52% cloud cost reduction. Transformed monolithic SaaS platforms into scalable microse

Delivery Principles

- We Measure the Money First — every engagement starts with a TBM-powered financial model the CFO can act on.
- Security Is Our Architecture — agentless zero trust is built in from the first blueprint, not added later.
- Compliance as Advantage — regulatory mandates (DPDP, GDPR) are baked into the code as trust signals.

Technical Executive FAQ

Q: What technology services does Mobiloitte provide?

A: Enterprise technology services across AI, cloud, cybersecurity, blockchain, web, mobile, automation, system modernization, and digital engineering.

Q: How does Mobiloitte support enterprise digital transformation?

A: Through discovery, architecture planning, engineering, security hardening, integration, deployment, and ongoing optimization.

Q: How do you measure and prove ROI for an enterprise AI project?

A: Enterprise AI ROI is measured by tying technology spend to baseline business KPIs such as cost reduction, revenue protection, and decision speed. TBM and FinOps models track cloud and AI costs by business unit to produce board-ready reports.

Q: What is agentless zero trust architecture in enterprise IT?

A: A security model that verifies every user, device, and AI agent at the network layer instead of relying on endpoint software, improving visibility and scaling across multi-cloud and IoT environments.

Q: What is AI governance framework implementation?

A: It defines what each autonomous agent can access and change in production, adding model provenance, identity management, and audit trails so AI decisions stay secure, explainable, and compliant.

Q: How do you handle DPDP Act and GDPR compliance?

A: Compliance is built into the architecture via consent management, data lineage, and automated ROPAs, shifting compliance from a manual audit exercise to a continuous system behavior.

Q: What is Integration Ops (IntOps) and why does it matter?

A: IntOps treats APIs and AI agent connections as continuously governed systems, preventing fragile integrations from becoming security and uptime risks by enforcing policy and audit logging automatically.

Q: How do multi-cloud AI interoperability solutions work?

A: Workloads move across AWS, Azure, and GCP without vendor lock-in or governance gaps, using standardized APIs and identity controls to keep datasets portable and secure.

Q: What is enterprise data fabric modernization?

A: It creates a governed data layer that connects siloed systems into a single trusted source, ensuring AI models and analytics pull from identical, clean data across the whole organization.

Q: Why combine blockchain with AI in enterprise environments?

A: Blockchain adds an immutable audit trail to AI systems, cryptographically recording autonomous events and making AI actions tamper-proof and easier to defend during regulatory investigations.
